It was an interesting week for this product in my area. Since I had signed for getting updates from them, one of the emails offered a 'Student Pack'. Out of curiosity I went to see it, decided to apply for a two-year free student license and was granted one. A lot of software packages that learning to use them should fill many unproductive hours. As the new wording goes: going to repurpose the time from idle to training tutorials.

2 Week in Review

This week was kind of bittersweet. One the upside, the course is about to end and managed to get my grades to the level I want, in spite of missing an earlier assignment with a big fat zero.

On the downside, now that the mechanics of this courses have been somewhat mastered, has to leave it alone for the next three months and that is sad, because these activities must be kept active.

Many items came into view clearly in my mind especially the importance of an ePortfolio in today's professional social media conscious environment.

Added some touches of visual items in some of my replies. And I believe in the future will be practicing more of the same.

Although several times I attempted to end this course early, not having that urgency that a 11:59 clock sets, this was a failed decision. Had some emergency situations at work that could not walk away until all was back to normal. In many occasions, after these events the one thing that is not desired is to turn on an electronic device and continue.

Another item was that applied for a seat in the hackathon of next week at FSU in Tallahassee. Received an email announcing that my application had been accepted. So will be spending next weekend networking and writing code for 30 straight hours. Enlarging professional network with other hackers.

3 Reflect and Connect

I have no issue with communications, written, oral or visual. However, it takes unusually long to finalize a document. I read and re-read, edit and re-edit and is not rare to spend hours in a single short paragraph. Has to do with the correct word to convey the exact thought and imagery.

So when there is a lot of writing or replying on the agenda, I know there are going to be many hours working on the final product. And even after it has been submitted, I may read it a couple of hours later and decide to edit it again.

My goal for this degree is work on developing mobile applications regardless of platforms or devices. Look forward to have these preliminary courses over with and start the activity of taking concepts from the drawing board to the digital world.

Can dream of the day that the Inbox is opened and see in it several headhunter messages announcing opportunities in MD projects.
